

Auto Ticket Classification using Flow Designer

Phase 1: Brainstorming & Ideation

Purpose: Define the project idea, identify the ticket routing problem, and propose an automated solution.

Section	Details
Project Idea	Automate incoming incident ticket categorization, prioritization, and assignment using ServiceNow Flow Designer.
Problem Identified	Manual ticket triaging leads to delayed response times, incorrect assignment group routing, and inconsistent ticket classification.
Proposed Solution	Build an automated workflow that scans incoming ticket details, automatically classifies category/subcategory, sets priority, and assigns the ticket to the correct group.
Expected Outcome	Faster ticket resolution (MTTR), eliminated manual triage bottlenecks, and accurate ticket routing across support teams.

Project Note: This phase document is prepared for organizing the project evidence and can be supplemented with your actual screenshots/configuration details.
