

Auto Ticket Classification using Flow Designer

Phase 2: Requirement Analysis

Purpose: Identify the functional and non-functional requirements of the auto ticket classification project.

Section	Details
Functional Requirements	Capture incoming ticket text (short description/description), evaluate rule-based or keyword criteria, auto-populate Category, Subcategory, and Assignment Group, and trigger assignment notifications.
User Requirements	End-users and service desk agents can submit tickets via portal or email without needing to know internal routing rules or technical assignment groups.
Admin Requirements	Administrators can easily modify routing keywords, update assignment matrix conditions, and manage trigger logic within Flow Designer.
Non-Functional Requirements	High accuracy in ticket classification, near-instant processing execution, auditability of automated updates, and maintainable workflow design.

Project Note: This phase document is prepared for organizing the project evidence and can be supplemented with your actual screenshots/configuration details.
