

Auto Ticket Classification using Flow Designer

Phase 5: Testing, Validation & Security

Purpose: Verify that ticket classification, assignment logic, security permissions, and error handling work correctly.

Section	Details
Functional Testing	Verify ticket creation via portal/email triggers the flow, correctly evaluates keywords, and populates assignment fields.
Positive Test	Submit tickets with clear keywords (e.g., "VPN issue", "Email password reset") and verify correct category and assignment group routing.
Negative / Edge Test	Submit tickets with ambiguous text or missing fields and verify the workflow falls back to a default Triage/Service Desk group without breaking.
Security & Access Control	Validate ACLs to ensure users can only view tickets assigned to their permissions while preserving automated system updates.

Project Note: This phase document is prepared for organizing the project evidence and can be supplemented with your actual screenshots/configuration details.
