

Auto Ticket Classification using Flow Designer

Phase 7: Deployment

Purpose: Prepare and deploy the auto-classification solution into the intended production environment.

Section	Details
Deployment Preparation	Review Update Sets / Application Repositories, verify flow publish status, roles, and decision table configurations prior to release.
Release Execution	Publish the Flow Designer workflow and migrate update sets to the target instance.
Post-Deployment Verification	Submit live test tickets to confirm active automated classification, field populates, and email alerts run without errors.
Maintenance Strategy	Establish ongoing monitoring of flow execution logs and periodically update classification lookup rules as business needs evolve.

Project Note: This phase document is prepared for organizing the project evidence and can be supplemented with your actual screenshots/configuration details
